

Insecticides and Pesticides – A Needles Waste

In 21st Century, population of developing countries is increasing day by day. And to fulfil the needs of food of this increasing population the agricultural sector has started using insecticides and pesticides as fertilizer in order to increase the production of crops. Instead of quality, quantity has become their priority. Ruthless activities of this sector have depleted Mother Earth to that extent that there will be one day when Earth will be no more. Maximum use of such chemicals is taking place in India and other agricultural Asian countries. Not only the Asian countries but also the Western Countries are involved in these activities. People eat these grains and health problems like asthma, cancer, poisoning are the consequences. The World Health Organisation estimates that there are 3 million cases of pesticide poisoning every year. People know everything, but no proper actions are taken to stop the use of such fatal chemicals. Apart from the health problems, the land also becomes infertile and raw and unfortunately, it becomes impossible to grow other crops. People are not able to take benefit of change of seasons and crop rotation stops. The only remedy to stop these arising problems is; the people should start using cow dung as a fertilizer to grow crops so that the health of the people sustains, increase in production, land remains fertile and worth of growing crops as per the seasons.

It is high time when people have to take strict actions against the use of such chemicals and give way to natural fertilizers like cow dung which is the only solution to save Mother Earth.
